

Ideas into investments

Buy what you **believe.**

Turn a belief about the world into
a basket of tokenized stocks.

Built on Solana. Starting with a clear thesis.

Product & partnership brief
Kayle · Builder

A great investment idea is a terrible to-do list.

The belief is clear. Turning it into a position takes work.

01

Find an idea

A thread, a report,
a strong conviction.

02

→ Pick exposure

Which businesses
actually benefit?

03

→ Assemble trades

Choose weights.
Buy each asset.

04

→ Keep the reason

What would make
you change your mind?

Our first user: a self-directed investor with USDC,
a Solana wallet, and a view on where the world is going.

Initial audience hypothesis. Trading access is limited to eligible markets.

The product unit is a thesis

One idea. Three businesses. Your conviction.

Understand the claim, inspect the exposure,
and choose your own allocation.

Illustrative allocation from the product. Public browsing and allocation editing work today; integrated checkout is the next release.

THESIS / FINANCIAL INFRASTRUCTURE

Financial activity moves onchain.

One claim, expressed through three
different business models.

Evidence for · Evidence against · Your weights

Make the investment logic visible.

Example thesis: “Financial activity moves onchain.”

 Coinbase The exchange	40%	 Circle The dollar	30%	 Robinhood The brokerage	30%
Trading, custody, and access to onchain activity.		Stablecoin infrastructure and reserve economics.		Retail access and distribution.	

↔ **The case against is part of the product.**
Onchain activity can grow while fees compress or value accrues somewhere else.

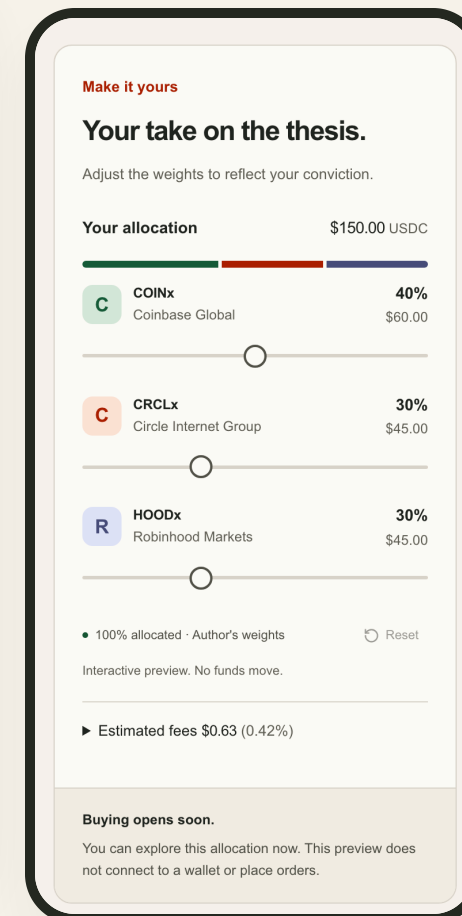

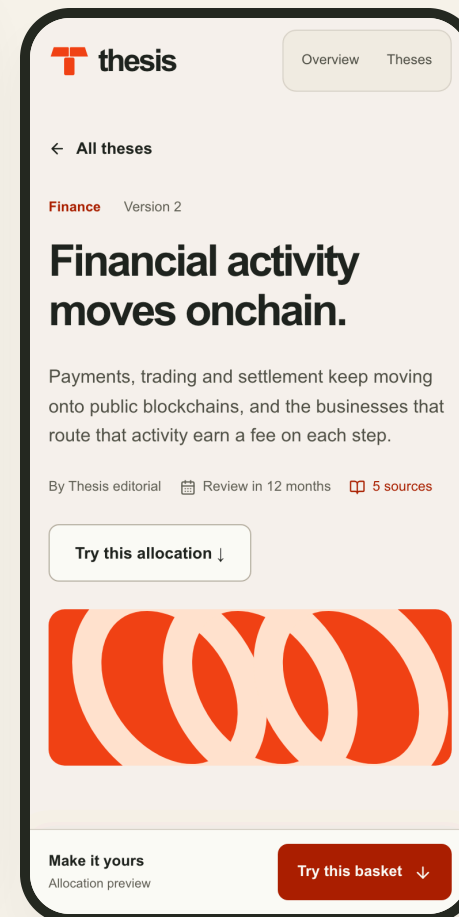

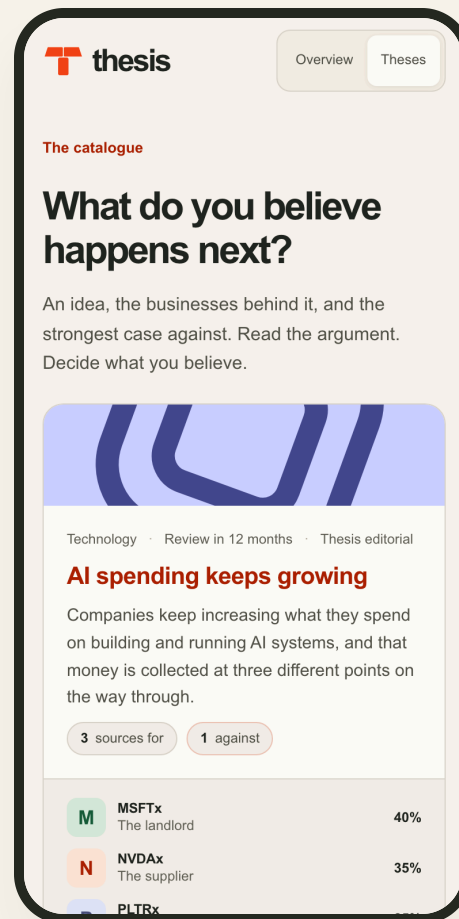

Illustrative exposure, not a return forecast or recommendation. [Read the thesis and its sources](#) ↗

From “I agree” to “here’s my take.”

Real screens from the current build.
No wallet needed to explore.

- 01 Find a belief**
Browse the catalogue.
- 02 Read the argument**
Inspect sources and tradeoffs.
- 03 Make it yours**
Adjust each holding’s weight.

Public allocation preview.
No orders are placed in these screens.

The assets are here. The next layer is the decision.

Solana connects the funding, the trades, and the ownership.

Existing assets.

xStocks supports tokenized equities on Solana.

Existing trade infrastructure.

Jupiter documents an order, sign, and execute flow.

A focused app layer.

One allocation plan, with each purchase confirmed separately.

Target execution design; public checkout is not yet connected. Access and liquidity must be validated per market and asset.

Sources: [xStocks integration information](#) · [Jupiter order & execute documentation](#)

The asset is the stock.

The product is the reasoning.

Distribution

A post starts the conversation.

Use existing social channels to bring people to an idea.

Exposure

A basket expresses the investment.

Show the businesses, roles, weights, and limitations.

Thesis's intended edge

Keep the reason with the position.

Carry the claim, sources, and review conditions forward.

What can compound

Trusted curators → useful evidence updates → repeat decisions

Positioning and retention hypothesis. Versioned research exists today; position-linked updates and creator distribution are planned.

Founder-led distribution

Earn the first 50.

One useful thesis.

One trusted introduction
at a time.

Recruit existing wallet users
in eligible markets.

10

Hands-on design partners

Personally recruit investors who already hold USDC. Watch them use the product.

40

Readers from five curators

Target eight additional testers per curator.
Share a specific thesis, then host a walkthrough.

Give them a reason to return.

Publish an evidence update and ask:
“Does this change your allocation?”

Acquisition targets, not existing users or committed partnerships. Track completed walkthroughs before funded activation.

Free to understand. Pay for an ongoing workflow.

Monetize useful research and tools once repeat use is proven.

TODAY

Open discovery

Public theses and allocation previews.

No added Thesis fee in the MVP.

TEST NEXT

Investor subscription

Proposed: evidence monitoring, portfolio overlap, and review tools.

EXPAND LATER

Curator & partner tools

Proposed: publishing workflows and embedded thesis distribution.

The first business test: will a returning user
pay for better ongoing decisions?

Business-model hypotheses. Pricing and willingness to pay are unvalidated. Third-party trading costs would still apply.

A working product surface. A focused path to live use.

Available in the current build

Research & allocation

- Three published, sourced theses
- Supporting and opposing evidence
- Adjustable three-stock allocations
- Mobile research and allocation flow
- Published versions in the data model

Private repository · access on request ↗

Pre-pilot stage. Public screens are previews; no user, revenue, or funded-volume traction is claimed in this deck.

Next release gate

Purchase → own → exit

- Connect the public checkout flow
- Verify a full purchase-to-sale journey
- Prove recovery after a partial fill
- Show holdings tied to the chosen thesis
- Validate market access and eligibility

Prove the loop before expanding the catalogue.

1

Reliability gate

A complete round trip

Complete an eligible purchase and sale, with reload recovery that never duplicates a fill.

2

Demand gate

A small, funded pilot

Target 20 eligible participants over two weeks.

Learning threshold: five voluntary purchases; three buyers return within seven days.

3

Retention & revenue gate

An evidence update worth revisiting

Bring holders back with new evidence, then test paid tools with repeat users.

Proposed validation plan, not achieved metrics or a revenue forecast. Pilot purchases depend on live execution and access readiness.

Let's make conviction investable.

Good ideas deserve a path to ownership.

Seeking pilot introductions, research curators,
and wallet or distribution partners.
