

A consumer investing network built around conviction.

Back the future you **believe** in.

Discover a thesis. Take a position.
Follow the evidence. Bring your people.

Starting with tokenized stocks on Solana.
Kayle · Builder

A FUTURE WORTH BACKING

Intelligence becomes a utility.

Every business can rent intelligence.
Who gets paid when it does?

NVDAx

MSFTx

AMZNx

THE BELIEF

THE POSITION

WHAT CHANGED

Illustrative product model · Existing allocation example

People discuss futures. Portfolios show tickers.

“I believe this will happen.” “How do I invest in it?”

DISCOVERY

The idea catches on.

A post, a conversation, a change in the world. The belief is easy to share.

DECISION

The exposure takes work.

Choose the companies, understand their roles, and decide what could go wrong.

AFTER THE TRADE

The reason gets lost.

A price moves. The original argument and the evidence often live elsewhere.

Our opening: keep the investment case connected to the position.

Initial problem hypothesis. First user: a self-directed, crypto-native investor with USDC and a view of the future, in an eligible market.

The thesis is the unit of discovery.

A belief. A clear allocation. A case you can revisit.

Buy exposure to the idea through underlying stock tokens.

See why each company belongs.
Keep the strongest objection visible.

EXAMPLE · INTELLIGENCE BECOMES A UTILITY

Who gets paid as AI becomes everyday infrastructure?

NVDAx	Compute supplier	40%
MSFTx	Cloud & enterprise distribution	30%
AMZNx	Cloud capacity & services	30%

THE OBJECTION

Adoption grows, but competition and heavy investment absorb the returns.

Allocation recorded in the local catalogue on 24 September. A broad, imperfect exposure to the idea; no claim of optimal weights or attractive current valuation.

Few strong ideas. Room for many perspectives.

New posts develop a thesis.
They do not need a new basket.

01 / COMPUTE

Intelligence becomes a utility.

Supply and distribution of AI.

Existing featured allocation

02 / FINANCE

Wall Street moves onto internet rails.

Access, settlement and distribution.

Existing allocation · Unfeatured

03 / POWER

The AI race runs on electricity.

The physical infrastructure behind AI.

Research · Not enabled

04 / AUTOMATION

Robots clock in.

Physical work becomes programmable.

Research · Not enabled

05 / HEALTH

Medicine rewrites appetite.

A larger market for metabolic treatment.

Research · Not enabled

06 / SECURITY

The internet needs an immune system.

Protecting an automated world.

Research · Not enabled

Editorial research directions, not six live products or independent risk exposures. Shared holdings and shared economic drivers must be disclosed.

“Is the future I backed actually arriving?”

A position with a reason to keep paying attention.

BACK

Make your call.

Choose the thesis, inspect the exposure, and take a position.

FOLLOW

→ See what changes.

New evidence and objections stay connected to the original belief.

REASSESS

→ Make the next decision.

Hold, add, reduce, or leave as your conviction changes.

World change → company economics → investment outcome. Keep all three visible.

Target experience and retention hypothesis. Continuous evidence monitoring and the complete portfolio/exit experience remain to be finished and validated. No automatic rebalancing.

Put a friend onto a future.

A gift can start the first position.

“You keep talking about this.
I put a little behind it for you.”

Choose a thesis → Send a pack → Claim with X

A trusted introduction lowers the cold-start burden.
The investing experience must earn the next visit.

Measure recipient self-funded investing and repeat use.
A pack open alone is not activation.

The initial acquisition experiment. Gift budgets fund USDC; stocks are purchased at claim-time prices. Revealing a pack is distinct from claiming it. Funded end-to-end use is unvalidated.

Pack artwork from the local preview · 23 September 2026

One good thesis can reach many new investors.

START · DIRECT RELATIONSHIPS

Investors bring friends.

Personal invitations and gifts establish the first reason to try Thesis.

EXPAND · TRUSTED CURATION

Curators bring ideas.

A useful investment case can travel through existing audiences and communities.

COMPOUND · REPEAT USE

Investors build portfolios.

People back further theses, revisit positions, and introduce others.

The ambition: a consumer investing network where conviction travels with context.

Proposed growth path, not proven virality or network effects. No creator partnerships or endorsement are claimed. Expansion depends on eligibility, liquidity and retention.

A repeat investing business.

Earn the next investment. Build revenue through repeat use.

CORE REVENUE HYPOTHESIS

Transparent execution fees.

Earn a disclosed fee when users choose to invest through Thesis. Repeated, voluntary investing is the economic engine.

A sender-paid gift fee could cover the initial distribution experience.

THE ECONOMICS TO PROVE

Value after real costs.

Fee revenue must cover execution, wallet infrastructure, identity, support and failed journeys.

Measure contribution per active investor and acquisition payback across direct and gift-led entry.

Business hypotheses, not implemented pricing or revenue. No fee rate, funded volume, CAC, LTV or margin is claimed. Small gifts alone may not support the business.

Curation, accountability and relationships.

Become the place people trust to turn a belief into a position.

USEFUL INVESTMENT CASES

Clear enough to act on.

Distinct ideas, intelligible exposure, honest overlap, and visible objections.

A RECORD OVER TIME

Conviction with context.

Who argued what, which allocation expressed it, and how the evidence developed.

TRUSTED INTRODUCTIONS

People worth following.

Useful curators and repeat investors can build relationships around shared interests.

A better place to discover, evaluate and revisit investments—not just assemble a basket.

Potential defensibility, not an established moat. Baskets and interfaces are replicable. A public investment record requires consent and verified data; performance alone does not prove skill.

The assets and execution exist. Build the experience around them.

FUND

USDC

A common funding asset.

DECIDE

Thesis

Belief, exposure and evidence.

EXECUTE

Stock tokens

Existing assets and swap routes.

HOLD

Your wallet

Underlying token positions.

A shared financial foundation.

Fractional stock exposure and wallet transfers make self-directed investing and personal distribution possible in one product.

Focus on the decision.

Thesis organizes the case and coordinates the allocation. A new speculative basket token is not required.

Stock tokens can lose value, are not stablecoins and do not confer direct shareholder rights. Access and liquidity vary. Sources: [Kraken / xStocks](#) · [Jupiter execution documentation](#).

The building blocks are in place.

Prove the investing habit.

PRESENT IN THE CODEBASE

Research → allocation → execution

- Theses, counterarguments and source evidence
- Versioned baskets and purchase integration
- Curated and custom stock packs
- X identity, funding and claim workflows

Funded gifting has not been validated end to end.
A complete return-and-exit journey is still required.

NEXT VALIDATION · PROPOSED

One eligible market. A small cohort.

- Start with 20 self-funded investors
- Validate purchase, claim and exit reliability
- Track repeat self-funded investing at 30 days
- Compare direct entry with gifted entry

Measure informed decisions, retention and net costs.
Current build claims are separate from the product vision.

Code and project documentation reviewed 25 September 2026. Production eligibility, provider readiness, wallet recovery and exit validation remain launch gates. No traction is claimed.

Trade Thesis

A portfolio of futures you believe in. People to bring along.

Building a consumer investing network,
starting with tokenized stocks on Solana.

Seeking early backers, pilot investors, and asset-access & execution partners.
